

## Further Pure 1 - January 2011

(1) a)  $\alpha + \beta = 6$        $\alpha\beta = 18$

b)  $\alpha$  Sum  $\alpha^2 + \beta^2 = (\alpha + \beta)^2 - 2\alpha\beta$   
 $= 6^2 - 2(18) = 0$

Product  $\alpha^2\beta^2 = (\alpha\beta)^2 = 18^2 = 324$

$\Rightarrow x^2 -$  Sum  $x +$  Product  $= 0$

$\Rightarrow x^2 + 324 = 0$

c)  $x^2 = -324$

$\Rightarrow x = \pm \sqrt{-324}$

$\Rightarrow x = \pm 18i$  which are  $\alpha^2 = \beta^2$  as they are roots

(2) a)  $\int_p^q \frac{2}{x^3} = \int_p^q 2x^{-3} = \left[ -x^{-2} \right]_p^q$   
 $= \left[ \frac{-1}{x^2} \right]_p^q = \frac{-1}{q^2} - \frac{-1}{p^2}$   
 $= \frac{1}{p^2} - \frac{1}{q^2}$

b) i)  $\int_0^2 \frac{2}{x^3} dx = \int_p^q \frac{2}{x^3} = \frac{1}{p^2} - \frac{1}{2^2}$   
 $= \frac{1}{p^2} - \frac{1}{4}$

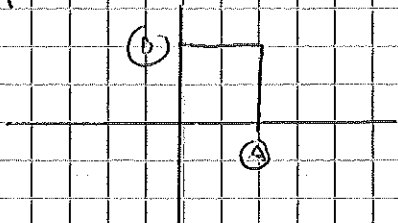

As  $p \rightarrow 0$ ,  $\frac{1}{p^2}$  does not converge to a limit

$\therefore \int$  has no value

ii)  $\int_2^\infty \frac{2}{x^3} = \int_2^q \frac{2}{x^3} = \frac{1}{2^2} - \frac{1}{q^2}$   
 $= \frac{1}{4} - \frac{1}{q^2}$

As  $q \rightarrow \infty$ ,  $\frac{1}{q^2} \rightarrow 0 \Rightarrow \therefore \int \rightarrow \frac{1}{4}$

(3) a)

i)  $\begin{bmatrix} 0 & 1 \\ -1 & 0 \end{bmatrix}$

ii)  $\begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix}$

b) i) AB

$$\begin{bmatrix} 2 & 4 \\ -1 & -3 \end{bmatrix} \begin{bmatrix} -2 & 1 \\ -4 & 3 \\ -20 & 14 \\ 14 & -10 \end{bmatrix}$$

ii)  $A+B = \begin{bmatrix} 2 & 4 \\ -1 & -3 \end{bmatrix} + \begin{bmatrix} -2 & 1 \\ -4 & 3 \end{bmatrix} = \begin{bmatrix} 0 & 5 \\ -5 & 0 \end{bmatrix}$

$(A+B)^2 = \begin{bmatrix} 0 & 5 \\ -5 & 0 \end{bmatrix} \begin{bmatrix} 0 & 5 \\ -5 & 0 \\ -25 & 0 \\ 0 & -25 \end{bmatrix} = -25 I$

c) i)  $\begin{bmatrix} 0 & 5 \\ -5 & 0 \end{bmatrix} = 5 \begin{bmatrix} 0 & 1 \\ -1 & 0 \end{bmatrix} = \text{Rotation } 90^\circ \text{ cw, enlargement SF } 5$

ii)  $-25 I = \text{Rotation } 180^\circ, \text{ enlargement SF } 25$

iii)  $625 I = \text{Enlargement SF } 625$

④  $\theta = 2n\pi + \alpha, \quad \theta = 2n\pi + (\pi - \alpha)$

Key angle =  $\sin^{-1}(-1/2) = -\pi/6$

$\cos x = 2\pi/3 = 2n\pi - \pi/6$

$\cos x = 2\pi/3 = 2n\pi + \pi/6$

$\cos x = 2n\pi + \pi/2$

$\cos x = 2n\pi + 11\pi/6$

$\alpha = 1/2 n\pi + \pi/8$

$\alpha = 1/2 n\pi + 11\pi/24$

⑤ a) i)  $z^2 = (1/2 - i)(1/2 - i) = 1/4 - 1/2i - 1/2i + i^2$   
 $= 1/4 - i - 1 = -3/4 - i$

ii)  $z^2 + z^4 + 1/4$   
 $= (-3/4 - i) + (1/2 + i) + 1/4$   
 $= 0 \quad \therefore z \text{ is a root}$

b)  $z_2^2 = (1/2 + i)(1/2 + i) = 1/4 + 1/2i + 1/2i + i^2$   
 $= 1/4 + i - 1 = -3/4 + i$

$$z^2 + z^* + \sqrt{6}$$

$$= (-3/4 + i) + (1/2 - i) + \sqrt{6} = 0$$

$\therefore z_2$  is a root

e)  $z_1$  &  $z_2$  are the roots

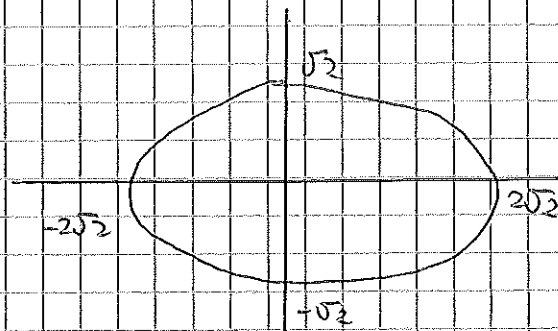

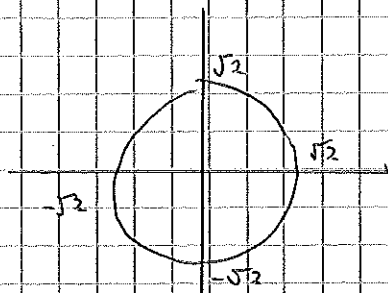

If they are real, then  $z = z^*$  as no imaginary terms

$$\Rightarrow z^2 + z + \sqrt{6} = 0$$

$$\Rightarrow (z + 1/2)(z + \sqrt{6}) = 0$$

$$\Rightarrow z = -1/2$$

6) a)

b) i)  $\frac{x^2}{2^2} + y^2 = 2 \Rightarrow \frac{x^2}{4} + y^2 = 2$

ii) Eq. of L was  $x + y = 2$

This was tangent at  $(1, 1)$

Curve stretched SF 2 in x-direction  $\rightarrow (1, 1) \rightarrow (2, 1)$

$\therefore x$  has been replaced with  $x/2$

$$\Rightarrow (x/2) + y = 2$$

7) a) For vertical asymptote,  $x^2 + a$  must = 0  
But, no real solutions for this

Horizontal: as  $x \rightarrow \infty$ ,  $y \rightarrow 0/1 \rightarrow y = 0$

b)  $y = k \rightarrow k = \frac{x-4}{x^2+a} \rightarrow k(x^2+a) = x-4$

$$kx^2 + ak = x - 4$$

$$kx^2 - x + (ak + 4) = 0$$

c) For real roots,  $b^2 - 4ac \geq 0$

$$\rightarrow (-1)^2 - 4(k)(4k+4) \geq 0$$

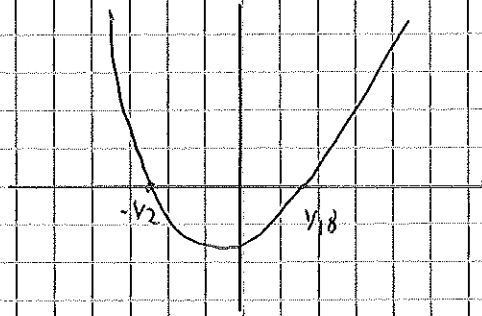

$$\rightarrow 1 - 36k^2 - 16k \geq 0$$

$$\rightarrow 36k^2 + 16k - 1 \leq 0$$

$$\rightarrow (18k - 1)(2k + 1) \leq 0$$

$$\downarrow k = 1/18$$

$$\downarrow k = -1/2$$

graph below axes when

$$-1/2 \leq k \leq 1/18$$

d) Stationary pt  $b^2 - 4ac = 0$

ie  $k = 1/18$  or  $k = -1/2$

$$k = 1/18$$

$$1/18 x^2 - x + (9/18 + 4) = 0$$

$$1/18 x^2 - x + 9/2 = 0$$

$$x^2 - 18x + 81 = 0$$

$$(x - 9)(x - 9) = 0$$

$$\rightarrow x = 9$$

$$(9, 1/18)$$

$$y = k \rightarrow 1/18$$

$$k = -1/2$$

$$-1/2 x^2 - x + (-9/2 + 4) = 0$$

$$-1/2 x^2 - x - 1/2 = 0$$

$$x^2 + 2x + 1 = 0$$

$$(x + 1)(x + 1) = 0$$

$$\rightarrow x = -1$$

$$(-1, -1/2)$$

$$y = k = -1/2$$

$$8) \quad a) \quad x^3 + 2x^2 + x - 100,000 = 0$$

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)}$$

$$x = 50$$

$$f(50) = 50^3 + 2 \cdot 50^2 + 50 - 100,000 = 30,050$$

$$f'(x) = 3x^2 + 4x + 1$$

$$f'(50) = 3(50^2) + 4(50) + 1 = 7701$$

$$\rightarrow x_2 = 50 - \frac{30,050}{7701} = 46.097...$$

$$\begin{aligned} b) \quad i) \quad S_n &= \sum_{r=1}^n (3r+1) = 3 \sum_{r=1}^n r + \sum_{r=1}^n 1 \\ &= \frac{1}{2} n(n+1)(2n+1) + \frac{1}{2} n(n+1) \\ &= \frac{1}{2} n(n+1) [2n+1 + 1] \\ &= \frac{1}{2} n(n+1)(2n+2) \\ &= \frac{1}{2} n(n+1) \cdot 2(n+1) \\ &= n(n+1)^2 \end{aligned}$$

$$ii) \quad n(n+1)^2 > 100,000$$

$$n(n+1)(n+1) > 100,000$$

$$n(n^2 + 2n + 1) > 100,000$$

$$n^3 + 2n^2 + n > 100,000$$

$$\rightarrow n^3 + 2n^2 + n - 100,000 > 0$$

c) From a),  $n = 46.097$  is a good approximation

$$S_{46} = 46(47)^2 = 101,614$$

$$S_{45} = 45(46)^2 = 95,220$$

$\therefore n = 46$  is the lowest
